

A
TREATISE
OF THE
EXTRAORDINARY VIRTUES
AND
EFFECTS
OF
ASSES MILK.

BOOKS printed for J. WHISTON and B. WHITE,
in, *Fleet-street*.

In One large VOLUME, OCTAVE,
(Price Six Shillings,)

Illustrated with Eight fine Copper-Plates,

- I. **A** COMPENDIUM of ANATOMY. In which all the Parts
of the Human Body are succinctly and clearly described,
and their Uses explain'd,

By LAURENCE HEISTER, M. D.
Professor of Physic and Surgery in the University of Helmstadt,
and Fellow of the Royal Societies of London and Paris.

Translated from the last Edition of the original Latin; greatly
augmented and improved by the Author.

To which are added, Notes by Mr. Henault, and the Editor.

II. HEALTH Preserved: In Two Treatises.

1. On the Diseases of Artificers, which by their particular
Callings they are most liable to; with the Method of avoiding them,
and their Cure. By BERN. RAMAZINI, M. D. Chief Professor
of Physic at Padua.

2. On those Distempers which arise from particular Climates,
Situations and Methods of Life; with Directions for the Choice
of a healthy Air, Soil and Water. By FREDERICK HOFFMAN,
M. D. Physician to the present King of Prussia. Translated
and enlarged, with an Appendix, by R. JAMES, M. D. Author
of the Medicinal Dictionary. In a large Volume 12mo. Price
2s 6d bound.

III. The 2d Edition corrected, illustrated with four large
Copper-Plates Price 1s 6d sew'd,

A TREATISE of the URINARY PASSAGES, &c.
Containing their Description, Power, and Uses; together with the
principal Distempers that affect them; in particular, the Stone of
the Kidneys and Bladder. By WILLIAM RUTTY, M. D. Fel-
low of the College of Physicians, and of the Royal Society, and
Reader of Anatomy at Surgeon's-Hall.

IV. New and Extraordinary Observations concerning the Pre-
diction and various Crises by the PULSE, independent of the cri-
tical Signs delivered by the Ancients, made by the long Experi-
ence of several eminent Physicians, and illustrated with many
new Cases and Remarks. To which are added, Some Hints on
Nature, the ancient Observance, and modern Neglect of
By JAMES NIHELL, M. D. The 2d Edit. Pr. 2s sew'd.

Plus's History of Stones, with an English Version,
and Philosophical Notes, including the Modern
&c. described by that Author, and many other
by JOHN HILL, M. D. Price 2s 6d sew'd.

TREATISE

W. Musgrave.

EFFECTS

OF

ASSES-MILK

In the Cure of various Diseases

Gout, Stomach, and Nervous

Disorders

And of its peculiar nourishing and restorative
Qualities in all Constitutional Disorders, and
even the Effects of Old Age.

Illustrated with several remarkable Cases

Translated from the Latin of the Author

FREDERICK HOLMAN, M.D.

Physician to the Royal Hospital, and Lecturer
on the Principles of Medicine at the University of London

LONDON

Printed for J. W. Norton and Benjamin White,
in Strand, near the Theatre Royal.
1801. Price One Guinea.

P R E F A C E.

TH-E great reputation which Dr. *Hoffman* has deservedly acquired by his superior abilities and long experience in his profession, has made his writings universally known and esteemed by the learned.

This treatise being intended for general use, he has wrote with more plainness, and with as few terms of science as possible, to render it generally useful, as the subject he

treats of is proper for every one to be acquainted with, whose state of health hath required the use of this common and almost universal remedy.

We thought it would not be amiss to prefix the opinions of those eminent physicians, *Dr. Moffett*, *Mr. Lemery*, and *Dr. Arbuthnot*, on the same subject, which we have therefore here adjoined, all which confirm and strengthen the sentiments of *Dr. Hoffman* in this treatise.

DR. MOFFETT in his treatise of foods, says, “ Asses milk is an
 “ especial cure for that sort of con-
 “ sumption,

“sumption, wherein the flesh de-
 “cayeth through ulceration of the
 “lungs and breathing parts; it is
 “both meat and medicine, cleans-
 “ing and nourishing alike, not so
 “thin as to hinder expectoration,
 “nor so thick as to cause condensa-
 “tion of the matter putrified, but
 “being of a middle temper and
 “consistence, and consequently most
 “proper for that disease. A middle
 “age Afs’s milk is the best. Hav-
 “ing got such a one, shut her from
 “her foal four or five hours before
 “you use her milk, let her be well
 “curried, lest her skin, growing
 “foul, ill vapours be encreased in-
 “wardly, for want of perspiration.

“Feed

“ Feed her with grinded malt-straw
 “ dried, mingled with a little sweet
 “ fennel-seed, annis, or carraway-
 “ seeds, which she will eat with
 “ great pleasure, and digest into a
 “ sweet and wholesome blood. An
 “ hour after that milk her as near
 “ the patient as you can, that it
 “ may be drank before the air hath
 “ alter’d it ; for if it be once cold
 “ it is not wholesome. This may
 “ be done twice a day, morning and
 “ evening, upon an empty stomach,
 “ neither eating or drinking after it
 “ for two hours : You may sweeten
 “ it with sugar-candy, sugar of roses,
 “ or fine honey, and it will be
 “ more effectual. In winter let her
 “ be

“ be fed with the sweetest meadow
“ hay.”

MR. LEMERY in his treatise on
foods, says, “ Asses milk, as to its
“ consistence and virtues, is much
“ like that of a woman ; it is much
“ used as a remedy against the phthi-
“ sick and other disorders of the
“ lungs, and being like woman’s
“ milk, is of a qualifying nature,
“ is beneficial in the cure of pim-
“ ples, the defluxions of the eyes,
“ and to ease the pains of the
“ gout.”

DR. ARBUTHNOT in his treatise
on aliments, page 85. observes, that
woman’s

"woman's milk is the sweetest as
"to the nutritious quality, *the next*
"to it is that of Asses."

THE translator hopes he has rendered the author's sense very clear, and wishing it may prove of general good, recommends it to the perusal of the publick.

November 10,
1753.

A Dr. Arbuthnot in his treatise
on aliments page 85. observes, that
woman's

A

T R E A T I S E

O F T H E

Extraordinay Virtues and Effects of ASSES MILK.

THOSE who have had a long and careful experience in the practice of physick, have a better opportunity than the rest of mankind of observing that the plainest sorts of remedies, those which are most readily prepared, and as it were at hand in every family, are highly preferable to all kinds of compounds, and artificial mixtures of drugs whatsoever; not only in regard to the safety in using them, but likewise in their real virtue and efficacy; whether they be intended to thoroughly subdue, or put a timely stop to all the various kinds of diseases.

B

If

If we diligently revise the best writings of physicians in the earliest ages, we shall find that they met with greater success, and wrought more cures with the most simple and easy medicines, such as are quite agreeable to nature, such as only require a regulation in diet, and have a greater share of nourishment than of physic in them, than the chemists of later times can effect with their inestimable secrets, and subtle compositions, produced by the force of fire. For all these, unless administered with the nicest care and discretion, instead of doing service, are sure to do much mischief; and therefore must be esteemed very dangerous, and far less eligible than those family remedies that may be used without any hazard at all.

UNDOUBTEDLY the refined art of chemistry, which brings to light the various mixtures and properties of natural substances, deserves a very great and peculiar degree of admiration; and the experiment is very surprising of the chemists, who are able to relieve the sufferings of their patients with a few drops only, or a very small pill: yet
when

when the larger or more plentiful preparations of what are called Galenical medicines are rejected, when no regard is shewn to the safe assistance of regulated diets, so much recommended by the antients, and medicines altogether chemical, are almost universally used against all diseases; the effect is, that the practice of physic is become far more dangerous in our days, than it was formerly, and gets discredit by more frequent instances of the loss of patients. For my own part, I was always guided by the following rule; that the only way to gain a happy and successful method in the healing art, is continually to unite theory with practice, the experience of the antients with that of the moderns, and Galenical and domestic remedies with chemical. For I have discovered by a long improved experience, that remedies which have blended in them the powers of both nourishment and physic, and are therefore pleasant and refreshing to the frame of our bodies, are not only the safest, but the most efficacious in the cure and prevention of diseases. And it is undeniable that the use and properest method of administering these, is more exactly to be learnt from the

remains of the antients authors, than from the works of the moderns, or even of such of the moderns as have plainly a fondness and partiality for the antients.

ONE of the most eminent and distinguished instances of what I thus assert is Asses milk: which, indeed, was strenuously recommended by the antient physicians, and esteemed of sovereign benefit in rooting out the obstinate remains of the most grievous distempers; yet most of our later physicians, in other respects men of high repute, are very ignorant of its most excellent qualities, and therefore were either so cautious, as seldom to introduce into their practice this desirable promoter of health, or actually were afraid to use it at all. In the following treatise therefore I intend, by fair and just arguments, founded on an extensive experience, to set forth all the admirable virtues of Asses milk, which have so long been absolutely forgotten and unknown.

BUT before we come immediately to the subject, it is not improper previously to shew in general, that all milk is a sort of
I food

food that has a singular medicinal virtue belonging to it, without considering its remarkable nourishing quality; which very weighty reasons should recommend its being medicinally used. That milk has this nutritive quality, must I think be readily allowed by all, as it appears constantly to every man, by his own experience, to be particularly constituted and adapted to the support of our bodies. The unborn child, while yet inclosed in the womb, grows and is nourished by milk, which is prepared for it in the structure of the secundines. When it is born, it acquires still additional firmness from a supply of milk; is gradually wrought up to its perfect form; and all its inward parts gain so much more strength in proportion as they are able to alter and digest whatever food they take in, and reduce them to the milky juice called *chyle*. Lastly, every man, so long as he remains alive, receives his whole nourishment and vigour from chyle, which is extracted from the food digested and dissolved, and is in truth no other than milk. It is milk that supplies the principles and materials, not of the blood alone,

alone, but of all the fluids that cherish and sustain life.

SINCE then milk is so manifestly proved to be the principal of all the kinds of aliment; so it may be deservedly reckoned the chief of all remedies. Which, though it may not seem clear and evident to others, may be proved to demonstration with very little difficulty. To begin then with experience, the best instructor in all things, and what is superior to all the most refined speculations.

No man, that has cultivated ever so slight an acquaintance with the medicinal art, can be ignorant that the milk of almost all animals has a very powerful and marvellous efficacy in tempering, subduing, and diminishing the force of the strongest poisons, whether they come from the kingdom of minerals, animals, or plants, especially those of a corrosive kind, that are most remarkable for fatal execution. And so great is this efficacy, that any person, who has taken poison, by a seasonable use of milk in a proper method and quantity, will be sure to escape

escape immediate death, and recover perfect health. On which account it may be reasonably questioned, whether there be any more ready and prevalent antidote to be found in the whole works of nature. And the most antient and early writers in medicine both knew and described the certain virtue of milk against poisons. *Dioscorides*, the most ancient writer concerning the *Materia Medica*, says, that milk, if fresh and new, is serviceable against corrosions and inflammations occasioned by deadly poisons, such as cantharides, ptyocampa, salamandra, or bupreste, orpiment, dorycnium, aconite, or ephemeron. And *Pliny* repeats almost the very same account.

IF we enquire into the treatment of diseases themselves, it will appear that milk was frequently and successfully employed against them, from numberless testimonies and examples to be found in many late authors, in common with those antient physicians *Hippocrates*, *Galen*, *Celsus*, and the *Arabian* writers. This will be more largely illustrated when we proceed to the subject of asses milk. At present let it suffice to
 produce

produce what we read in *Martian*, " That
 " heretofore milk was esteemed the sacred
 " anchor and foundation of all remedies : so
 " that there was scarce any distemper in
 " which milk was not made use of." The
 same is attested by *Jo. Jac. Wepfer*, an
 eminent author, and noble ornament of the
 faculty among the *Dutch*. " There is surely
 " some divine quality belonging to milk.
 " Formerly I could not have believed it,
 " had I not had convincing experience of
 " it. Mine own eyes have seen men intirely
 " renewed by it. For by a discreet use of it,
 " multitudes have acquired a sounder consti-
 " tution, more hale complexion, and greater
 " strength of body."

BUT though the milk that is generally used
 in the medicinal way, is that of the common
 domestick sorts of animals, as cows, sheep,
 and goats ; yet asses milk is by far the most
 efficacious, and its virtues in phyfic exceed
 those of every other species so much, that
 no sort of remedy is to be discovered so safe,
 and so powerful in its effects. For this,
 taken at seasonable times, in due quantities,
 and with a proper regimen, gives eminent
 relief

relief to such as are afflicted with phthitics, hectic, consumption and slow consuming fevers, chronical coughs, and a scorbutic atrophy, hypochondriac and hysteric disorders, cramps, ulcers in the bowels, and diseases that proceed from a saline acrid erosion. This consideration induced me to fix upon this sort of milk, above all others, for the subject of my observations, in order to set forth its powers and properties, to demonstrate its usefulness, and confirm it by testimonies and examples.

IN the first place, we must assign the reason why Asses milk is to be preferred in medicine, before that of other creatures. Which may be done in a more convincing and satisfactory manner, if we previously lay down some certain stated propositions, concerning the composition of milk, and those ingredients which are the foundation of all its operations. It is universally known that milk consists of three different substances, each of which has a different quality and powers peculiar to itself. The first is the fluid part, commonly called *serum*, or *whey*. The next is the oily fat part, which exhibits itself in cream

on the surface, and is to be wrought into butter. The third is of a coarser nature, earthy and mucilaginous in its texture, and of this cheese is formed. The serum, or watry portion, exceeds the others in quantity, so that in different milks, there will be found eight or ten parts of this fluid, to one only of solid. The butter, or oily fat substance is the lightest, and the least in quantity, and inflammable in its nature. And lastly the curd is of a more fixed and heavy temper, is very readily hardened by acids, and subsides to the bottom in the substance of cheese.

THE efficacy of every sort of milk in curing and subduing any disease, is derived from this threefold nature of the ingredients that constitute the substance of milk. For that milk which is thin and liquid, and contains a larger proportion of serum, is preferable for its faculty of moistening, diluting, cleansing and relaxing. Again, that which is heavier, and has much of the gross substance of curd, is valuable for its excellence in hardening, confirming and consolidating the broken vessels.

BUT

BUT that which produces a great share of cream, and likewise a considerable quantity of the curd-like substance, is eminent for its softening, smoothening, and nourishing quality. If we examine the different species of milks that are in common and daily use; the human is the sweetest of all, of a very soft and rich temperature, and is the best accommodated for the nutriment of the human body. That of cows is fatter, has more of the earthy and less of the watery substance, and is therefore less fitted for cleansing the vessels, but best formed for softening, tempering and nourishing. Sheeps milk is the most gross, and very full of the earthy mucilaginous curd; whence it has little of a cleansing power, but is extremely useful for closing up such blood vessels, or lymphatics, as are injur'd and corroded by acrid humours. Goats milk has very little serum, and is of a pretty thick and astringent consistence, produces very little butter, yet is more cleansing and diluting than cows milk.

THIS different proportion in the ingredients of milk, and the difference of beneficial

effects arising therefrom, is not so much to be ascribed to the food of the animals, (of which more largely hereafter,) as to the different texture and conformation of their bodies. For tho' we were to feed the various milch-creatures with the same sort of food, for the same length of time, and in the same manner in all respects, yet would they not give milk of one and the same nature, but each of its own and peculiar kind. It is therefore a very evident truth, that the matter and quality of the food conduces but little towards the formation of milk, but that it is altogether brought to perfection by the peculiar nature of the animal, which consists in a distinct composition and texture of the fluids, (namely, the temperature of the blood and other juices,) and a particular make, structure, and constitution of the solids, especially of the glands belonging to the udder, which are composed of numberless fine vessels.

WHEN we examine more minutely into the medicinal virtue and disposition of Asses milk, it will appear to be fraught with an abundance of peculiar excellencies which render it so exceedingly wholesome. In the first

first place, it is thinner than all other milks, and abounds with watery and ferous ingredients. This is what *Aristotle* and *Galen* have both observed, who call it *λεωτομερίτωρον*, composed of the minutest particles. Since then it is known that many diseases are caused by a grossness and tenacity of the juices, which, as they pass slowly thro' the finer vessels, of which the principal emunctories and strainers of the glands consist, are apt to stop in those narrow passages, to fill them up, and occasion obstructions, it is very obvious and natural to conclude, that the use of Asses milk, which abounds with ferous and fluid particles, must be extremely proper to open the obstructed vessels, to attenuate the gross and viscid juices, and set them in an easy and free motion. Again, when we know that multitudes of distempers proceed from an acrid, salt, and corrosive state of the fluids, we cannot but be assured that the thin serum of Asses-milk will not fail of diluting, softening, and subduing them: altho' it must be allowed at the same time, that the sweet oily substance contributes much toward this effect, which embraces and involves the pointed particles of salt, and by this means the crude, ill-di-

ill-digested juices, being properly corrected, are, by the plentiful assistance of serum, convey'd in their due course thro' the vessels appointed for secretion,

It is another extraordinary excellence of Asses milk, that it contains but a small proportion of the grosser curdling substance. Out of eight ounces of Asses milk which I set over hot coals in a broad vessel, after all the serum was evaporated, I could scarce gather so much as six drachms of a whitish sweet matter. I then took twelve ounces of the same milk, and set it by to curdle in a close vessel, filled about half way. In three days time a very white and thin curd settled at the bottom, which when separated from the whey by straining thro' filtrating paper, and afterwards dried, scarce amounted to two drachms; all the rest of its solid parts having in part passed with the whey thro' the strainer, and partly adhered to the sides of the vessels, or lost themselves in the operation. On the contrary, the same weight of cows milk, treated in the same manner, thickened into a grosser and heavier curd, which when clear'd from the whey, spread
out

out in a broad plate, and dried in the sun, weighed ten drachms. From these experiments it is evident, that the quantity of the gross curdling substance is very small in Asses milk, when compared with other sorts. For this reason it easily diffuses itself into the minutest extremities of the blood-vessels, thoroughly dilutes the vital juices, liquifies the sluggish humours, and when it has thus dissolved them conveys them off. A third circumstance that more strongly evinces the salubrious quality of Asses milk, is, that the share of cheese-like substance which it contains is extremely soft and tender, and never makes a gross or firm curd. To make this evident, I warmed some Asses milk, and sprinkled it with vinegar, expecting to see it contract a thick consistence; but nothing appear'd of that sort, except a few light thin flakes floating here and there on the serum: when, on the contrary, cow's milk, the instant it was mixed with an acid, condensed into lumps of a considerable hardness, and fell to the bottom. Now in all cures which are sought by milk, nothing can be so hurtful and dangerous as to have it curdle in the stomach, to prevent which accident ought
to

to be the physicians principle care and concern. For the mischiefs occasioned by a coagulation of milk in the stomach are very pernicious, and have been observed and cautioned against by the best authors. It is past dispute therefore that that milk is the most wholesome and properest for medicinal uses, which has least tendency to curdle, which is the case with Asses milk in the most remarkable degree.

A fourth, and the most valuable excellence in Asses milk, is its exquisite sweetness, in which it exceeds all other species of milk, except the human: for you may extract from it by much the greatest quantity of delicate tasted sugar, or rather a thick substance resembling manna. To try the experiment, I boiled twelve ounces of Asses milk, in the month of July, over a gentle fire, and immediately it produced a thick concretion very sweet, weighing one ounce. Upon this I poured it into a glass with a pint of rain water, which when frequently shaken almost dissolved the mass, leaving only a small sediment. The liquor was then poured through filtrating paper, and set to evaporate,

2

and

and yielded half an ounce of an honey-like substance, extremely sweet, and white. As Asses milk therefore contains so plentiful a proportion of sweet salts, we cannot doubt but it has for that reason a very singular medicinal quality which cannot be expected in other kinds of milk. For this honey-like salt greatly softens, checks and moderates the acrimony of humours, whether acid or bilious, and by gently irritating the fibres of the bowels, urges them to their office and operation. *Hippocrates* very justly observes, that Asses milk disposes to purging more than any other. And in another place advises, as a remedy for the Fluor Albus, first to occasion a gentle purging by drinking Asses milk, and then to change it for cows milk.

FROM these enlarged observations which we have made on the excellencies of Asses milk, it must be evident to all that judge sensibly, that it has an admirable efficacy towards curing many distempers. It may now be proper to enumerate those distempers in regular order, and explain the usefulness of this milk in each particular. The first and most remarkable instance we shall

D

give,

give, by proving that no surer or more successful remedy can be invented or recommended against *consumptions*. The use of milk in such diseases had long been practis'd, till the physical schools of Cnidos and Cos exploded it: at length *Hippocrates*, who came from the latter, vindicated and established its credit, and was universally followed in it by all the physicians of the next age, *Galen* says a great deal in praise of milk in consumptive cases; and speaks of a place, called *Stabia*, very famous for its good air, pasture for cattle, and their wholesome milk, which was filled frequently with crouds of consumptive people that came thither for relief. And *Areteus* ascribes so extraordinary virtues to milk in this grievous distemper, that he does not scruple to affirm, that if consumptive folks would drink great quantities of milk they would need no other remedy.

YET although milk of all kinds be a wholesome medicine in consumptive and decaying constitutions, yet Asses milk excells the others in a greater degree, because it fully answers every requisite that can conduce to the cure of consumptions. If we strictly enquire into the

the

the cause and origin of a consumption of the lungs, it will be found to proceed from a stoppage and obstruction of the vessels, of which the lungs are almost entirely composed. Whence *Hippocrates* very properly and ingeniously describes the rise of a consumption in these words; "when the lungs have collected a quantity of blood, or salt phlegm, and cannot discharge them, but they settle and fix there, they occasion little pustules to rise; which suppurate at first; and thro' the whole distemper there continues a sharp dry cough, chilliness, a fever, a pain in the breast and back, and sometimes a strong wheezing both in lying down and sitting up, and then the patient begins to spit up much corrupted matter." — It was usual with the ancients to vary their prescriptions of milk for consumptions, and sometimes order Asses milk before, and sometimes after the use of other milk; as different occasions required. *Hippocrates* advises purging with Asses milk boiled (or Mares milk strained, which much resembles Asses milk) and drank every morning to the quantity of about a quart; after which he recommends cows milk, or goats.

PROSPER ALPINUS greatly recommends the use of woman's milk at first, then Asses, and lastly goats, in a consumption and ulceration of the lungs. For my part, I am convinced both from reason and experience, that Asses milk alone is sufficient for the cure of this terrible disease. For nothing can be so properly adapted as this is, by its abundance of sweet deterfive salts, to cleanse away and disperse the matter that obstructs the vessels and pipes of the lungs. Besides, it greatly restores decay'd strength, cools the heat of the intestines, fills out the wasted limbs, and preserves a free and open perspiration. Yet I do not deny, but when the obstruction of the vessels in the lungs is cured, cows milk or goats, by reason of their plenty of gross, earthy substance, may be proper to fill up and consolidate the cavities made by the corrosive ulcers.

If I may be allowed to produce my own experience, I could recount many instances of consumptive people, who were afflicted with an obstinate cough, a fever, a great discharge of viscid matter from the lungs, and

and an amazing waste of the whole body; and who, after an ineffectual trial of other remedies, by my directions took to a long continued course of Asses milk, or cows milk, (either with or without some sort of tea,) and perfectly recovered. But omitting others, I shall only relate one very late case, which is now fresh in my memory: *A man, about thirty years old, of a very debauched life, and given to all kinds of intemperance, especially drinking of spirituous liquors, first fell into a spitting of blood, which being cured, tho' after a long continuance, he contracted a fever, which at first had the appearance of a defluxion, but at length consumed his strength, and afflicted him night and day. He continually spit up a great discharge of purulent and viscid matter, his strength failed, and his flesh wasted so speedily, that he could not walk about, and was given over by every body. Yet, after he had laid three months in this sad condition, by God's blessing he recovered, unexpectedly, at the return of the spring, on drinking goats milk warm every morning, after I had administered gentle, opening, saline-absterfve and*
nitrous

nitrous powders, to remove his obstructions, and hectic heat.

YET we must take notice, that tho' this be such a sovereign remedy for consumptions, and when given in a judicious manner, scarce ever fails of success, yet it will not cure every sort of consumption; but must be applied in the beginning of the distemper, and is most likely to take effect, before the ulcers be grown callous, or the corroded cavity be too deep and large, or the fever become continued and without intermission. *Celsus* justly advises, " If it be a real consumption, you ought to attack it as early as possible; for when this distemper is of long date, it is not easily conquered. But in the beginning, as in all lasting and obstinate fevers, the use of milk is proper." And *Alpinus* very discreetly says, that a regular course of milk will cure consumptions in their beginning, before the ulcers be grown large and callous.

As a spitting of blood, difficulty of breathing, wasting of the flesh, and a small fever,

all

all generally inseparable companions of a consumption of the lungs, are occasioned by the same cause, namely, an obstruction of the vessels of the lungs, and pustules that arise from thence, which in the height of the distemper grow to a scirrhus and cancerous ulceration, there is no more powerful help against all these symptoms, than Asses milk, and it has always been recommended by the most antient and able physicians. There is a remarkable passage in *Trallian*, which says, " If the whole body receives no benefit from food, but begins apparently to waste away, and the breast does not discharge much matter, they ought to live on milk only, and that of Asses excels all others, because it purges to a proper degree." The same author again commends Asses milk for a difficulty of breathing: " Such as are afflicted with a difficulty of breathing, I have often known relieved by Asses milk, when given properly, for it clears and removes whatever is fixed in the vessels of the lungs." And in another place, speaking of spitting blood, he says, " All that spit blood find relief from milk. For there

" is

“ is no medicine or food of any kind so
 “ suited to their case as milk : and those
 “ that took to the use of that alone at first,
 “ and persevered in it for a long time, have
 “ all recovered their health. I knew a
 “ man that by living on milk for a whole
 “ year, and entirely abstaining from wine,
 “ was cured of a spitting of blood and
 “ matter, and escaped falling into a con-
 “ sumption.”

A consumption with a slow feverish heat,
 is most times caused by a stoppage or ob-
 struction in the smaller vessels, thence pro-
 ceeds a stagnation of the humours, either in
 the lungs or bowels, and glandulous parts of
 the belly. Now Asses milk serves to moisten
 and remove these obstructions ; it likewise
 cools and checks the violence of the feverish
 heat. Whence 'tis evident, that a right use
 of Asses milk is not only extremely service-
 able, but the very best of all remedies in a
 slow fever. *Hippocrates* agrees with us in
 this, and advises those that have a consump-
 tion and small fever to drink milk. And
Riverius relates a remarkable case of a young
 lady of *Montpellier*, aged 25, who had been
 long

long confined to her bed with a cough that harraſſed her night and day, perpetual watching, a pain in her ſtomach, a ſlow fever, coſtivenefs, and a general decay of the whole body, who was perfectly recovered by drinking Affes milk for one month, after being prepared for it by a laxative cooling julep.

To this let me add a moſt ſingular caſe that came within my obſervation a few years ago. A gentlewoman had for many years been ſubject to much ſickneſs, but now for half a year together was afflicted with a ſlow fever, a loathing of food, languidneſs of the limbs, a dry cough, watchings, a great pain about the Os Sacrum, heat of urine, profuſe ſweats by night, and ſo entire a waſte and decay in fleſh and ſtrength, that ſhe was unable to ſtir from her bed. In vain had ſhe been ply'd with decoctions, anti-hectic powders, ſtomachicks, anti-hyſterics, reſolvents, and a thouſand other things ; ſhe lay paſt all hopes, and in expectation of certain death. At length, in the beginning of the ſpring, by my directions, ſhe took to Affes milk, taking between whiles a little opening manna, mixed

E

with

with some cooling nitrous powders, and now and then some nourishing broths prepared with laxative roots, and with such happy success, that in three days only, every thing appeared wonderfully amended; and tho' the cure was not entirely compleated in many weeks, she was at last perfectly restored to her health and vigour.

I likewise judge Asses milk to be very efficacious against an Empyema, which is often caused by a pleuresy improperly treated, especially in bodies of a spongy habit, and shews itself by a constant and copious spitting of matter. To confirm which opinion I shall relate a remarkable case as told by *T. Valleriola*: A woman, after recovery from a pleuresy, began to discharge, by spitting, great quantities of purulent matter, which reduc'd her to a miserable, thin, emaciated, and lifeless condition. The author tried to relieve her breast of that load of filth by deterfive drinks, linctus's, broths, and such sort of things, but without success: at length, as her fever was not very high, nor any obstruction appeared to be in the Hypochondria, or the bowels, he prescribed
Asses

Asses milk fresh milked, and sweetened with a little sugar, which having drank for six weeks, she recovered her health and a good constitution, and died twelve years after in child-bed. I likewise remember, many years since, when I practis'd physick at *Minden*, a nobleman, thirty years of age, of a full and sanguine habit of body, who, after a pleuresy injudiciously treated, fell into so very great a spitting both of purulent and chylous matter, which lasted more than a month; and that he sometimes spit more than a pint a day, and was thereby surprizingly weaken'd and emaciated. I ordered him to drink Asses milk, with powders of crab-shells and bole armonic, balsam of sulphur of almonds, sperma ceti, and dragons blood mixt; when he had done this for two months, by the assistance of providence he was happily cured, to the admiration of all that knew him.

BUT yet, 'tis not only in these diseases which affect the lungs and other intestines with a cough, fever, waste and consumption, that Asses milk has this admirable and divine efficacy, but it is also wonderfully

serviceable for soothing, abating, and lulling the fierceness of pains in the nervous parts of the body, chiefly those that fix themselves in the joints. These diseases, such as the gout in the hands, feet, and hips, are caused by a sharp, thin serum, issuing out of those glands which were discovered by *Clopton Havers*, nay through the coats of the glands, and falling on the articulo-nerveo-tendinous ligaments, which corrodes them and occasions most acute pains, cramps, and contractions of the limbs. This, in time, affects the whole system of the nerves, and brings on a fever, watching, anxiety, languidness, want of appetite, and universal restlessness, if the fit be very violent. In these rheumatic and gouty cases, the whole mass of humours is infected with foul, salt, tartarous, and sharp particles; which is perhaps owing to some antecedent cause, a fullness of blood, some suppression of a critical discharge from the blood, irregular living, or excess in eating; and yet some modern practitioners are apt to confound these remote causes with the proximate, the salt foulness of the humours, and prove themselves quite ignorant of the nature of this distemper,

distemper, as well as of the method of applying remedies. For it's evident from experience, that all such remedies as sweeten the juices, correct the sharp salts, and as it were sheath-up their points, and at the same time gently promote each different kind of excretion, go a great way towards relieving the violence of the distemper, soften and mitigate the sharp pains, and in a great measure cure the disease itself, unless it be hereditary, or of a very long date.

Now milk, and particularly that of Asses, is by far the best and most excellent of this sort of remedies, excepting the diluting decoctions that are prepared from roots. Nor is its excellence any late discovery of the moderns, but the earliest writers in physic, and all their followers, highly recommended and approve it. *Hippocrates* advises, in a sciatica, first a purge, and then a course of Asses milk. And in the same treatise, he adds, it is proper in the gout first to soften the bowels with a glyster or suppository, and after a purge to drink warm whey or Asses milk. *Pliny* tells us many have been relieved from pains in the joints by drinking milk.

And *Celsus* says, many people, by a long course of Asses milk, have been so thoroughly cleared of this distemper, as to be free from it ever after. Among the moderns, *Gabriel Fonseca, Hollerius, Ballonius, Baglivi, Sydenham, Sachs, Griselius, Pecclinus, Dolæus, Waldschmidt*, and many more, all agree, from numberless experiments and observations, in allowing milk, and especially Asses milk, to be the principal comfort and relief of gouty and rheumatic persons,

AND I can from my own knowledge assert, that after using gentle laxatives made of manna, solutive syrup of roses, and some absorbents mixed, I have found the drinking of goats milk, (where Asses could not be had) for many days together, without meat or drink of any other sort, has given great benefit; the pains have grown milder, and of shorter continuance, and all the other symptoms have ceased. I have known many gouty old men, who after drinking Asses milk with manna for the three first days, and then continuing it alone for a fortnight, have found their pains greatly abated: but when they laid aside this remedy, their torture was most
intense

intense and obstinate, and confined them to their beds for some months. Yet this must all along be observed, that in these distempers the good effects of milk is more speedy and certain where the patient is young, the disease not inveterate, the gout not fixed to a particular part, nor transmitted by inheritance.

As Asses milk proves so very useful in relieving the pains that seize the outward parts of the Body, so it is likewise no less serviceable against those that affect the inward nervous parts, the stomach and intestines, as is the case in convulsive cholics. This very beneficial effect of it is to be accounted for in the following manner: The Asses milk, being diluting, corrects and overpowers the acrimony of the bilious juices, softens and relaxes the contracted fibres with its serous and slippery particles, and with its sweet ingredients renders the bowels laxative; then that corrosive matter which occasions all the pain, is readily conveyed off by stool, and all is easy and quiet. The truth of this *Ballonius* asserts, and although *Hippocrates* forbids the use of milk where there are bilious purgings, yet,

yet, if there be no remarkable fever to corrupt the milk, I think it should be given. For if it may be thrown into the bowels by a glyster, without any hurtful effect, why not also into the stomach?

WHEN cramps and convulsions seize the nervous parts, which is the common symptom in hypochondriac and hysteric fits, I have always observed milk, especially that of Asses, do great good; provided there be no costiveness, nor obstruction in the bowels, and the first passages be not clogged with sharp and viscid phlegm. Hence *Sydenham* highly approves the use of milk in what he calls the hysteric cholic. "Many women," says he, for a long while troubled with "hysteric disorders, especially that which I call hysteric cholic, have been quite cured by" only living on milk for some time." *Bened. Sylvaticus* bestows the highest praises on Asses milk in hypochondriac complaints, which he directs to be sweetned with sugar, and made a moderate purge by a small mixture of powdered fenna, and drank for forty days together. And although *Hippocrates* forbids milk where the hypochondria are distended

stended, that is, when the stomach is expanded with wind, or the belly swoln and overcharged with blood, yet I have often learn'd from indisputable experience, that the hypochondria are not always thus oppressed, but that the stomach and adjoining intestines are often tortured with contractions caused by the sharpness of the humours, and blood that stagnates in the finer vessels, and that this disorder is successfully removed by milk.

For the same reason this judicious author zealously recommends Asses milk, in madness and hypochondriac melancholy, which are occasioned by spasms, that force too great a quantity of blood into the head, so that it cannot circulate equally and freely thro' the vessels of the membranes that inclose the brain: and if it be drank every morning to the quantity of four or five ounces, for the space of a month, or longer, it corrects the acrid humours, eases the contractions of the fibres, cools and relaxes the bowels, and by gradually removing the cause, subdues that terrible disorder. But in order

F

for

for more certain success, it is proper to make an addition to the purging quality of the milk, by mixing a little manna; the happy effects of which I have very often experienced.

SINCE therefore it is so evident that Asses milk is beneficial to the nerves, and heals their several fore-mentioned disorders by means of its softening and lubricating quality, we cannot doubt but it may be properly administered in other complaints, where the nervous parts are likewise afflicted and disordered with violent motions, as in epilepsies and convulsive fits. This is affirmed by that eminent author *Sylvaticus*, in many places; and I can attest the same with confidence. For I could produce very many examples of it, but one in particular of a youth of noble birth, about fourteen years of age, and of admirable parts and understanding. Having been struck by some sudden fright, he was instantly seized with strong convulsions in his limbs, chiefly his legs and arms: and after much anxiety and uneasiness of spirits, was oppressed with entire swoonings,

swoonings, so that the fit came sometimes every other day, sometimes every day, about the evening, and pursuing him for the space of two months, reduced him to a very weak condition. Many physicians were consulted, who gave him various medicines, but without any effect: at last he was ordered to drink every morning about three ounces of Asses milk, now and then with a little manna, and to be put in a warm bath every other day, taking between whiles some anti-epileptic powders: in a month's time the disorder disappeared, and the patient, by the divine blessing, recovered his health and strength.

LET us consider those grievous disorders that attend the scurvy, such as a wasting of the flesh, fierce pains and contractions of the limbs, external ulcers and erosions. All which are derived from a total distemperature of the juices, a suppression of those very useful evacuations of sweat and excrement; from a defect in the secretion of the bilious humours in the spleen; from a salt sulphureous foulness in the humours; and likewise from

their too thick consistence, which retards their natural progress, and obstructs the finer vessels. Now nothing can be so proper to open these closed passages, to remove obstructions, to correct the acrimony of the humours and to dissolve their viscosity, as diluting, moistening and cooling remedies, such as the whey of goats milk, or, what is still preferable to all, Asses milk.

THE strongest testimony I can produce in favour of this eminent good quality in milk, is that of the best author that ever wrote upon the scurvy, *Eugalenus*, who says, “ I
 “ have seen many people recover out of the
 “ scurvy from the use of milk and milk-diets,
 “ with a stronger and better constitution than
 “ those that have lived under the rules and
 “ prescriptions of physicians.” And he mentions several that have been cured of scorbutic fevers by milk, though contrary to the prescription of *Hippocrates*, in his aphorisms. And I myself could produce a multitude of examples within my own experience of people afflicted with a wandering scorbutic gout, (a national distemper in *Westphalia*) whom I
 absolutely

absolutely cured, when I practised physick at *Minda*, with no other medicine than Asses, or other sorts of milk, if it were not needless to tire the reader with so many illustrations of a thing that is so clear and evident.

WHEN scorbutic people and old men, who are naturally subject to a salt and foul corruption of the humours, and likewise such as are infected with a venereal taint, are afflicted with dangerous ulcers that seem to resemble cancers; even in these terrible symptoms a very speedy and sure relief may be had from Asses milk, and the whey of it. Which, as it is evident from all the above-mentioned arguments, is likewise confirmed by the authorities of many authors both antient and modern. *Dioscorides* recommends milk, mixed with honey, or salt, in all sorts of ulcerations in general, as well inward as outward, for violent itching in the skin, pimples, and foul humours of the body. *Galen* advises the use of Asses milk for ulcers in the uterus, the reins, the bladder, and pudenda. To these we may add
the

the assertion of *Sylvaticus*, that Asses milk drank for thirty or forty days together, not only entirely cured a cancerous swelling in the neck of the uterus, but also a venereal ulcer, attended with a consumption and slow fever. Again, the same author commends the same remedy for the cure of that herculean distemper, the elephantiasis, in these words; "Asses milk drank every morning to the quantity of a quart, with a little sugar, and cream of tartar, to render it purgative, is a very excellent remedy for the elephantiasis." And *Ambrose Parey*, in his book of surgery, says, he has known by experience the admirable efficacy of Asses milk, in cancerous ulcers, both taken inwardly, and applied outwardly in fomentations.

AND while we are enumerating the many noble virtues of Asses milk, we must not omit its peculiar excellence not only as a remedy to the distempers of old men, but as a sort of food of great efficacy in restoring their decayed strength. With regard to its medicinal excellence in relieving old age, we have

have elsewhere shewn at large, that in an advanced age, the blood and all the juices contract a great degree of foulness and corruption, from obstructions in the excretory glands and vessels, whence in time proceeds variety of distempers, the most remarkable of which are indigestion, languidness in the limbs, consumption of the solids, a low fever, and *pruritus*. And all these are to be relieved by a proper use of milk. And on this account it has always been held in great esteem both by the ancients and moderns; for it is very efficacious in rendering the humours fluid when they are too thick, in diluting those that are salt and acrid, in relaxing the too rigid and tense fibres, and in restoring the excretions, when disturbed, to their proper order, as it not only cleanses the foul juices, but likewise breeds a proper supply of good ones. It will be sufficient for the present purpose to produce the authority of *Trallian*, who strongly recommends Asses milk to old people who are under a consumptive wasting; and the reason he gives for it is, because they have but a small share of strength, and are neither able to separate
nourish-

nourishment from common food, nor to distribute it thro' the constitution; wherefore the milk of women is first to be prefer'd, and next to it that of Asses.

If we enquire into the nourishing and analeptic property of Asses milk, by which it retards the decays of old age, and restores the strength of those who have been reduced by distempers, no body can hesitate to give the preference to this kind of milk above any others.

BUT it may not perhaps be disagreeable, or improper, to produce the authority of authors of great credit, who have treated of this subject. I shall begin with the recommendation that *Helmont* gives of it; who, altho' in other parts of his writings he condemns the use of milk, yet in *Libr. de Digest. Aliment.* ascribes a particularly refreshing invigorating and nourishing property to that of Asses, supposing that the Ass, as a long-liv'd animal, is furnish'd with milk preferable to any others. *Eryphon*, as *Hærodotus* relates, relied altogether on Asses milk
for

for restoring old and emaciated people. I myself also knew an officer of the army, who was restored to his former health and ease by Asses milk, tho' he was almost entirely wasted away with the venereal distemper and excruciating pains that had afflicted him for several years. *Heurnius* also relates, that Asses milk prevents old age and wrinkles; for which reason, no doubt, it was that *Poppæa*, the wife of *Nero*, always ordered a hundred Asses to be kept, that she might bathe every day in their milk, to preserve her skin white, soft, and smooth.

HAVING now explained the property of Asses milk, and its excellence in several disorders, I shall proceed to the proper method of giving it, and then shew what is necessary to be observed in order to expect success from it. But it will first be proper to say somewhat of the animal itself. A milch Ass ought to be quite free from any disorder, not very old, but of a middle age, neither too fat nor too lean, and may be esteemed the better if she bring her foal in the month of *May*. She ought not to be

fed in a house, but kept in meadows which produce plenty of medicinal herbs; she should drink river water, which, as it is lighter and more diluting than spring water, passes off quicker by the proper discharges, and mixing more thoroughly with the humours, cleanses them more effectually. *Helmont* has an ingenious remark on this subject: he advises that the Afs should be combed or curried every morning as horses are, for that it may easily be known from the milk, whether she has been dressed that morning or not. Without doubt there may be some reason for this, because the use of the curry-comb increases perspiration, and cleanses the humours, by passing off a great many saline particles that way.

It ought to be consider'd too what the Afs is fed with, because the nature and properties of the milk of animals is alter'd by their diet, so as to be more or less wholesome, or even adapted to some particular disorders. For as it is a common practice to make a purging or alterative medicine given to the nurse, communicate its properties

perties to her milk and take effect on the
 child, so no doubt the same will hold good
 in regard to the animals whose milk we use.
Galen proves this by the instance of goats,
 who are fed with scammony or spurge,
 whose milk is purging. *Dioscorides* and
Hippocrates are of the same opinion, and in
 the *Acta Haffniensia* it is asserted, that worm-
 wood eaten in large quantities makes the
 milk bitter. From hence it is that *Caelius*
Aurelianus commends milk in the celiac
 passion, or flux, which is taken from goats
 that feed on willows, vine leaves, oaks, or
 fallows, plaintain, and plants of the same
 nature; giving this reason for it, "because
 "the astringent quality of the herbs com-
 "municates itself to the milk." But there
 is a remarkable difference between the milk
 which is produced in spring from green pa-
 sture, and that in winter from dry food.
Varro, who was very well acquainted with
 what belong to country affairs, was of this
 opinion, and says, "that milk from barley
 "and stubble, and all kinds of hard and dry
 "food is nourishing; but that is more cleans-
 "ing which comes from green pasture." And

Dioscorides thinks that milk in spring is thinner, and because it comes from green pasture, more laxative and softening.

FROM whence it plainly appears, that milk of all sorts, but more especially Asses, is not only most serviceable in the spring, but that its virtues may, by a regulation of food, be so prepared, as to be particularly effective against any one distemper. Wherefore I should advise that a milch Ass be fed with such herbs as in themselves are known proper for the disease you would relieve. In a consumption, and diseases of the lungs and breast, let her be supplied with veronica, ground ivy, the blind or dead nettle, colts-foot, scurvy-grass; or, if you want to restore the vigour of the solids, with fanicula, tansey, nummularia, consolida-major, flowers of St. John's-wort, alchimilla, polygonum, and the like; or let the creature be drove to places where these plants abound. In pains and spasms, both inward and external, it may be useful to mix in her food yarrow, chamomile flowers, acacia, mead-wort, tilia, melilot, spurge, mallows,

mallows, marsh mallows, and others of this nature. In slow and hectic fevers, (besides those we named as good for the lungs) we may add plantane, prunella, and scurvy-grass mix'd with germander. If the hypochondria are obstructed, and cause a scorbutic foulness in the juices, choose out some herbs of the opening or laxative kind ; such are fumitory, the lesser centaury, absinthium, scurvy-grass, trefoil, water-cress, nasturtium, and the lesser house-leek. In the same manner may milk be rendered medicinal, and fit for almost any complaints, by administering such herbs and flowers as the physician shall esteem most proper and effectual.

As to the method of using it, these following rules may be observed.

1. In cases of necessity, Asses milk may be drank at all times ; but it is by far the most serviceable in the spring and summer, when all the herbs are full of juices, and greatly enrich the milk.
2. The milk should be milked into a pail set over hot water, and
imme-

immediately put into a vessel that has a narrow mouth, and shuts close, and so drank directly while it is warm; for milk, like all other liquors, has a subtle spirit, of a strengthening and invigorating quality, which by no means ought to be allowed to fly off with its warmth. Hence *Galen* orders that milk be drank instantly, and the animal brought to the patient's bed-side; for that its nature, like that of the semen, is at once altered by the open air. 3. The morning is the best time of day to drink, as it will operate the easier in an empty stomach; and therefore no other food ought to be taken in four or five hours after it. Yet, if circumstances require a frequent repetition of it, it may be drank in the afternoon; but it should be about four hours after dinner has been digested, and in but half the quantity that is drank in the morning. 4. 'Tis impossible to prescribe in general any fix'd quantity that should be used, because of the difference of ages, constitutions, and distempers; but thus far may be said, that you ought never to exceed the quantity of three common pints. 5. The time of continuing it must be directed

rected by the degree and strength of the distemper : if that be very obstinate, it were well to continue drinking it for three months, or longer ; especially if a favourable prospect appears of success, and the violence of the symptoms abate very discernably.

YET a prudent and experienced physician will so order, regulate, and methodise the use of this medicine, as almost to insure success, and avoid any hurtful consequences. I shall therefore conclude with a few cautions that should be observed very accurately.

I. BEFORE a course of milk is begun, the state and condition of the stomach must be carefully inquired into : Whether it will bear milk, and have a sufficient degree of strength to concoct, digest, and then discharge it. For if that be weak and infirm, if it be troubled with wind and phlegm, or be loaded with a croud of acid humours, milk must not be taken ; because, until these things are remedied, that will curdle and stagnate, and corrupt, and increase the flatulence and uneasiness. It will be proper therefore to
 cleanse

cleanse and relieve the stomach first, either downwards, by a gentle dose of manna, or, where the case will allow, by a vomit with a grain or two of emetic tartar. 2. Great care must be had that the milk be not turned to curd. And therefore where the food is apt to grow acid in the stomach, as is the case with old and hypochondriac people, it is adviseable to give absorbent, earthy, and alkaline medicines, mix'd with the milk, adding likewise some stomachic carminative essence, or volatile oily salt. 3. When the patient has drank milk for six or eight days, a gentle dose of manna should be given, to purge the bowels, and carry off whatever foulness the stomach may have contracted, that the farther efficacy of the milk be not retarded. 4. It is best to drink it at first sparingly, three or four ounces, and then to increase the draught gradually, that the stomach be not too suddenly oppressed, and conceive a dislike and loathing to the remedy. 5. A proper regulation of diet must be observed during the course of milk. The lightness of food must be chiefly consulted; avoiding not only meats hard of digestion, but also

also those that are reckoned to afford little nourishment, and likewise all flatulent victuals, summer fruits, and acids of all kinds; abstaining from all malt liquors, and wines, except a small quantity of the soundest *Spanish* wines. Nor should any bread be used that is lumpy and fermented, but what is made of the cleanest and finest wheat flour.

In the last place let me add some instances, wherein the use of milk may be judged improper. In head-aches arising from crudities in the stomach, in very acute fevers, and when the bowels are overcharged with gross blood, milk is very pernicious: being no less improper when the Stomach is cold and filled with acids, than when in a heat and ferment, as it is in fevers, and when the bilious humours abound, because in both cases it quickly turns to a foul and offensive putrid state. Milk is also very prejudicial to those who, either through neglect of bleeding, or a total suppression of the discharge of the piles, or the menses, are afflicted with a too great and unnatural share of

H

blood

blood, and consequently with a foulness of the humours. Which agrees entirely with the observation of *Hippocrates*, That the more you nourish distempered bodies, the more you injure them. For unless the excess of blood be reduced by moderate bleeding, and the faulty digestion amended by medicines that correct the whole mass of fluids, all sorts of milk must be avoided, as extremely hurtful and dangerous.

F I N I S.

This Day is Published, Price 5s. bound,
In ONE VOLUME, OCTAVO,

The SECOND EDITION, beautifully printed, of
HIPPOCRATES upon AIR, WATER, and
SITUATION; upon Epidemical Diseases; and
upon Prognostics, in Acute Cases especially.

To which is added,

The Life of Hippocrates, from Soranus, and Thucydides's
Account of the Plague of Athens. The Whole translated, metho-
dised, and illustrated with useful and explanatory Notes.

By FRANCIS CLIFTON, M.D.

Fellow of the College of Physicians, and of the Royal Society.

Printed for J. Whiston and B. White, at Mr. Boyle's Head in
Fleet-street,
